DISPOSABLE TROUBLESHOOTING

Unclogging

If the light won't turn on when trying to hit it, 99% of the time it is due to a clogging of the thick distillate.

(Note: clogging is unfortunately fairly common with this type of product.)

Method 1

Step 1: Blow hard into the USB port 3-4 times from 3-4" away, similar to blowing into an old video game cartridge.

Step 2: Take a couple of hard pulls on the mouthpiece. Once a little air gets through, it should clear up any obstruction and allow the airflow-activated sensor to work again!

This trick fixes 90% of all clogging issues.

Method 2

If Method 1 did not unclog your vape, proceed with the following steps:

Step 1: Take a blow dryer on a medium heat setting and warm up the device in the area of the distillate level window for 10-15 seconds.

Step 2: Repeat steps from Method 1.

TIPS FOR MINIMIZING CLOGGING: Do not leave outside and be sure to store in a warm place. The more it is used, the less prone to clogging it will be.
